

Scrambled Quote

All-Day Sprint 2013

Here is one of my favorite quotes:

```
eE*urmaP*thats*icisn*myitwas*ire*thpo*cet*olof*gil*y*ids.eaanin*estAie
```

Unfortunately, it is a bit scrambled. I would like you to unscramble it for me. So, let me explain exactly what I did to it.

Suppose we have a string of characters, like “the*string”. Let us identify the individual characters in the string by giving each one an *index number*. The index number of the leftmost character in the string is a zero, and each other character in the string has an index number which is one greater than the index number of the character to its left. So, for example, in “the*string”, the index of the “s” is 4.

If I apply **scramble(n)** to a string, I switch any character whose index is evenly divisible by the number n with the character whose index is $n-1$ greater (if the string is long enough to have such a character).

Get it? (Note: I consider zero to be evenly divisible by any n .)

So, now I can tell you that I produced the scrambled quote above by starting with a string that was the actual quote and then applying **scramble(10)**, followed by **scramble(2)**, followed by **scramble(3)**, followed by **scramble(66)**, and finally **scramble(2)** again.

The question you need to answer, then, is what was the original quote? Please unscramble it and write your answer below:
